

EVENTI AVVERSI DELLA TERAPIA SISTEMICA:

QUALI CAUSE? QUALI TERAPIE?

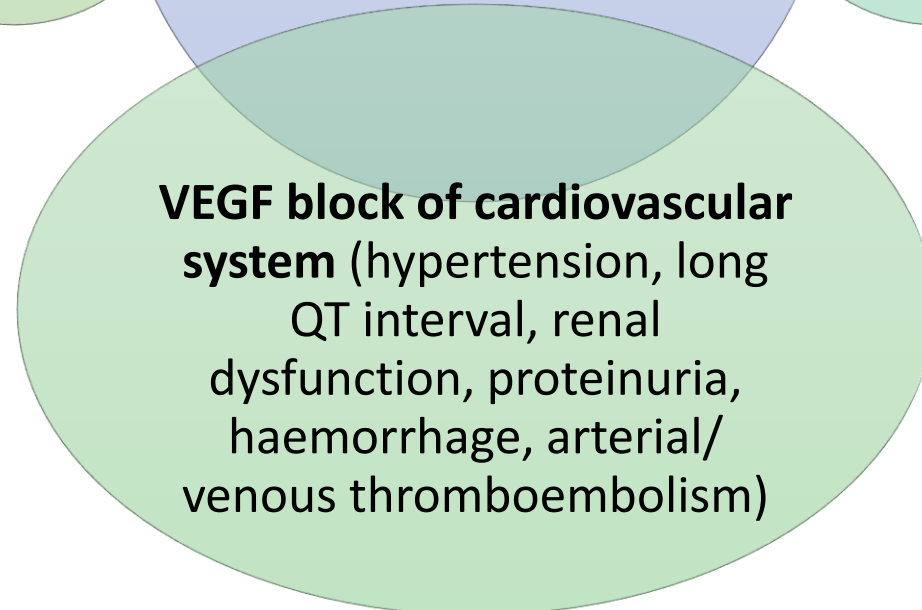

Carla Colombo

Università degli Studi di Milano

Istituto Auxologico Italiano

The initiation of TKI treatment for advanced MTC needs to balance the improvement in PFS with tolerability of adverse effects.

Main severe toxicities

AEs Treatment

symptomatic
treatment of adverse
events

dose reduction

Drug interruption,
restarting at a lower
dose

Start of tyrosine kinase inhibitor treatment: first evaluation

- Explain in detail to the patient, family and/or care giver how to manage therapy, the goals of treatment, and the drug-related adverse events
- Evaluate the main vital parameters and general haematochemical examinations
- Assess body mass characteristics (objective examination and Body Impedence Assessment)
- Evaluate the patient's cardiovascular status before starting therapy
- Perform a nutritional assessment to evaluate the dietary style and caloric intake of the patient
- Perform a psychological examination before the beginning of therapy

Tailored evaluations performed **during MKIs therapy** (weekly, monthly or bimonthly)

cardiovascular, gastrointestinal,
hepatic or nephrological alterations

specific evaluation by the multidisciplinary team,
endocrinologist/oncologist
(dose reduction? discontinuation?)

absence of adverse events

maintenance of therapy with
routine follow-up

Created with BioRender.com

Clinical Trials

TABLE 1 | The main characteristics of the ZETA, EXAM, and SELECT trials, including eligibility criteria and adverse events (AEs).

| Drug | Trial | Trial design | Patients (n) | Eligibility criteria | All grades AEs (%) | | Grade > 3 AEs (%) | |
|---------------------|---|---|--------------|--|---------------------|------|---------------------|------|
| Lenvatinib | SELECT Schlumberger et al., 2015 (2) | Phase III, randomized, double-blind, vs. placebo | 261 | 18 years or older + measurable, pathologically confirmed DTC + 131I-refractory disease | Hypertension | 67.8 | Fatigue/asthenia | 27.5 |
| | | | | | Diarrhea | 59.4 | Nausea | 13.7 |
| | | | | | Fatigue/asthenia | 59 | Decreased appetite | 11.5 |
| | | | | | Decreased weight | 50.2 | Decreased weight | 9.2 |
| | | | | | Nausea | 41 | Hypertension | 9.2 |
| | | | | | Stomatitis | 35.6 | Diarrhea | 8.4 |
| Vandetanib | ZETA Wells et al., 2011 (17) | Phase III, randomized, double-blind, vs placebo | 231 | Adults + measurable, unresectable, advanced/ metastatic MTC + performance status ≥ 2 + serum CT ≥ 500 pg/ml | Diarrhea | 56 | Diarrhea | 11 |
| | | | | | Rash | 45 | Hypertension | 9 |
| | | | | | Nausea | 33 | QT prolonged | 8 |
| | | | | | Hypertension | 32 | Fatigue | 6 |
| | | | | | Headache | 26 | Decreased appetite | 4 |
| | | | | | Fatigue | 24 | Rash | 4 |
| | | | | | | | | |
| Cabozantinib | EXAM Elisei et al., 2013 (25) | Phase III, randomized, double-blind, vs. placebo | 219 | Adults + unresectable, advanced/metastatic MTC + disease progression within the prior 14 months | Hypertension | 32.7 | Hypertension | 8.4 |
| | | | | | Hemorrhage | 25.2 | Venous thrombosis | 5.6 |
| | | | | | Venous thrombosis | 5.6 | Non-GI fistula | 3.7 |
| | | | | | GI perforation | 3.7 | Hemorrhage | 3.3 |
| | | | | | Non-GI fistula | 3.7 | GI perforation | 3.3 |
| | | | | | Arterial thrombosis | 2.3 | Arterial thrombosis | 0.9 |
| | | | | | | | | |

Long-term follow-up and safety of Vandetanib for advanced medullary thyroid cancer

NON LONG-TERM

Time of occurrence of AE in

Cabozantinib in Progressive Medullary Thyroid Cancer

Rossella Elisei, Martin J. Schlumberger, Stefan P. Müller, Patrick Schöffski, Marcia S. Brose, Manisha H. Shah, Lisa Licitra, Barbara Jarzab, Viktor Medvedev, Michael C. Kreissl, Bruno Niederle, Ezra E.W. Cohen, Lori J. Wirth, Haythem Ali, Colin Hessel, Yifan Yaron, Douglas Ball, Barry Nelkin, and Steven I. Sherman

Table 3. AEs Associated With VEGF Pathway Inhibition

| AE | Cabozantinib (n = 214) | | | | Placebo (n = 109) | | | |
|--------------------------|------------------------|------|----------------|-----|-------------------|------|----------------|-----|
| | All Grades | | Grade ≥ 3 | | All Grades | | Grade ≥ 3 | |
| | No. | % | No. | % | No. | % | No. | % |
| Hypertension | 70 | 32.7 | 18 | 8.4 | 5 | 4.6 | 1 | 0.9 |
| Hemorrhage | 54 | 25.2 | 7 | 3.3 | 17 | 15.6 | 1 | 0.9 |
| Venous thrombosis | 12 | 5.6 | 8 | 3.7 | 3 | 2.8 | 2 | 1.8 |
| GI perforation | 7 | 3.3 | 7 | 3.3 | 0 | | 0 | |
| GI fistula | 2 | 0.9 | 1 | 0.5 | 0 | | 0 | |
| Abdominal/pelvic abscess | 5 | 2.3 | 2 | 0.9 | 0 | | 0 | |
| Non-GI fistula | 8 | 3.7 | 4 | 1.9 | 0 | | 0 | |
| Arterial thrombosis | 5 | 2.3 | 2 | 0.9 | 0 | | 0 | |
| Proteinuria | 4 | 1.9 | 2 | 0.9 | 0 | | 0 | |
| Wound complication | 4 | 1.9 | 2 | 0.9 | 1 | 0.9 | 0 | |
| Osteonecrosis | 3 | 1.4 | 1 | 0.5 | 0 | | 0 | |
| RPLS | 1 | 0.5 | 1 | 0.5 | 0 | | 0 | |

Abbreviations: AE, adverse event; RPLS, reversible posterior leukoencephalopathy syndrome; VEGF, vascular endothelial growth factor.

Hypertension

Hemorrhage

Venous thrombosis

GI perforation

Non-GI fistula

Arterial thrombosis

NO QT prolonged

Cardiovascular AE

Hypertension and cardiovascular toxicities can be life-threatening AEs
(especially in patients receiving Vandetanib)

Hypertension

Before starting treatment,
control patients blood pressure.

Blood pressure < 140/90 mm/Hg and checked
daily in the first 2 months of treatment.

If necessary antihypertensive agents

QT prolongation

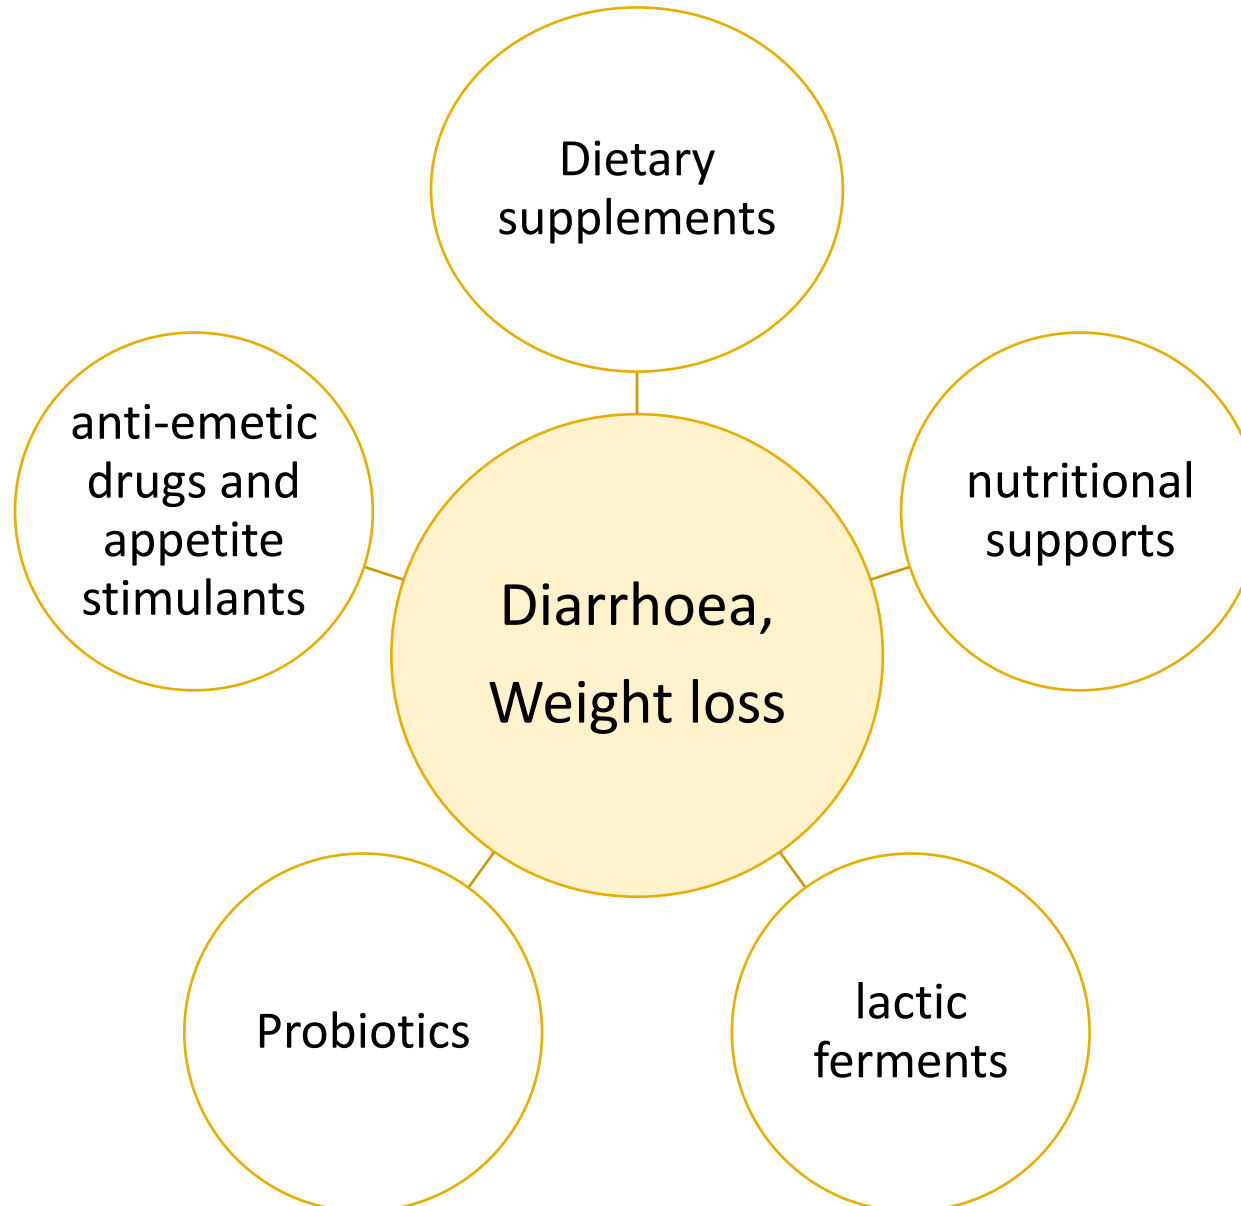

13 clinical trials (4.204 patients) with
multitumor types who received vandetanib 100
or 300 mg daily

- The incidence of QT prolongation ranged from **0.3 to 23.9%**
- AF incidence ranged from **0.43 to 1.79%**

EKG cardiac should be done **every 1–2 weeks in
the first month** of treatment, then **once a
month** for the first three months, and then
according to the patient's overall health status

In addition, **other drugs which may induce QT
prolongation** need to be considered in the drug
combination

Gastrointestinal AE

Proteinuria

in MTC trials, the prevalence was

- **1.9%** for cabozantinib
- **59%** for lenvatinib
- **0%** for vandetanib

- Proteinuria significantly **related to TKI duration**

- a **late-onset** toxicity occurring after a mean treatment period of 38 months

- proteinuria is a sign of renal damage during TKI, but **usually asymptomatic and well manageable**

- not a valid reason for discontinuing the therapy because of its presumed role as marker of anti-tumoral efficacy.

- a **mild decline of renal function**, independently from proteinuria

- related to the aging and/or to the several contrast medium of CT scan

Skin AEs

rash and folliculitis

photosensitivity

dry skin, acne

palmar plantar
erythrodysesthesia

Practical measures:

- urea or aluminium lactate-based topical creams
- comfortable gloves and shoes
- Avoid aggressive soaps, hot water, trauma and friction

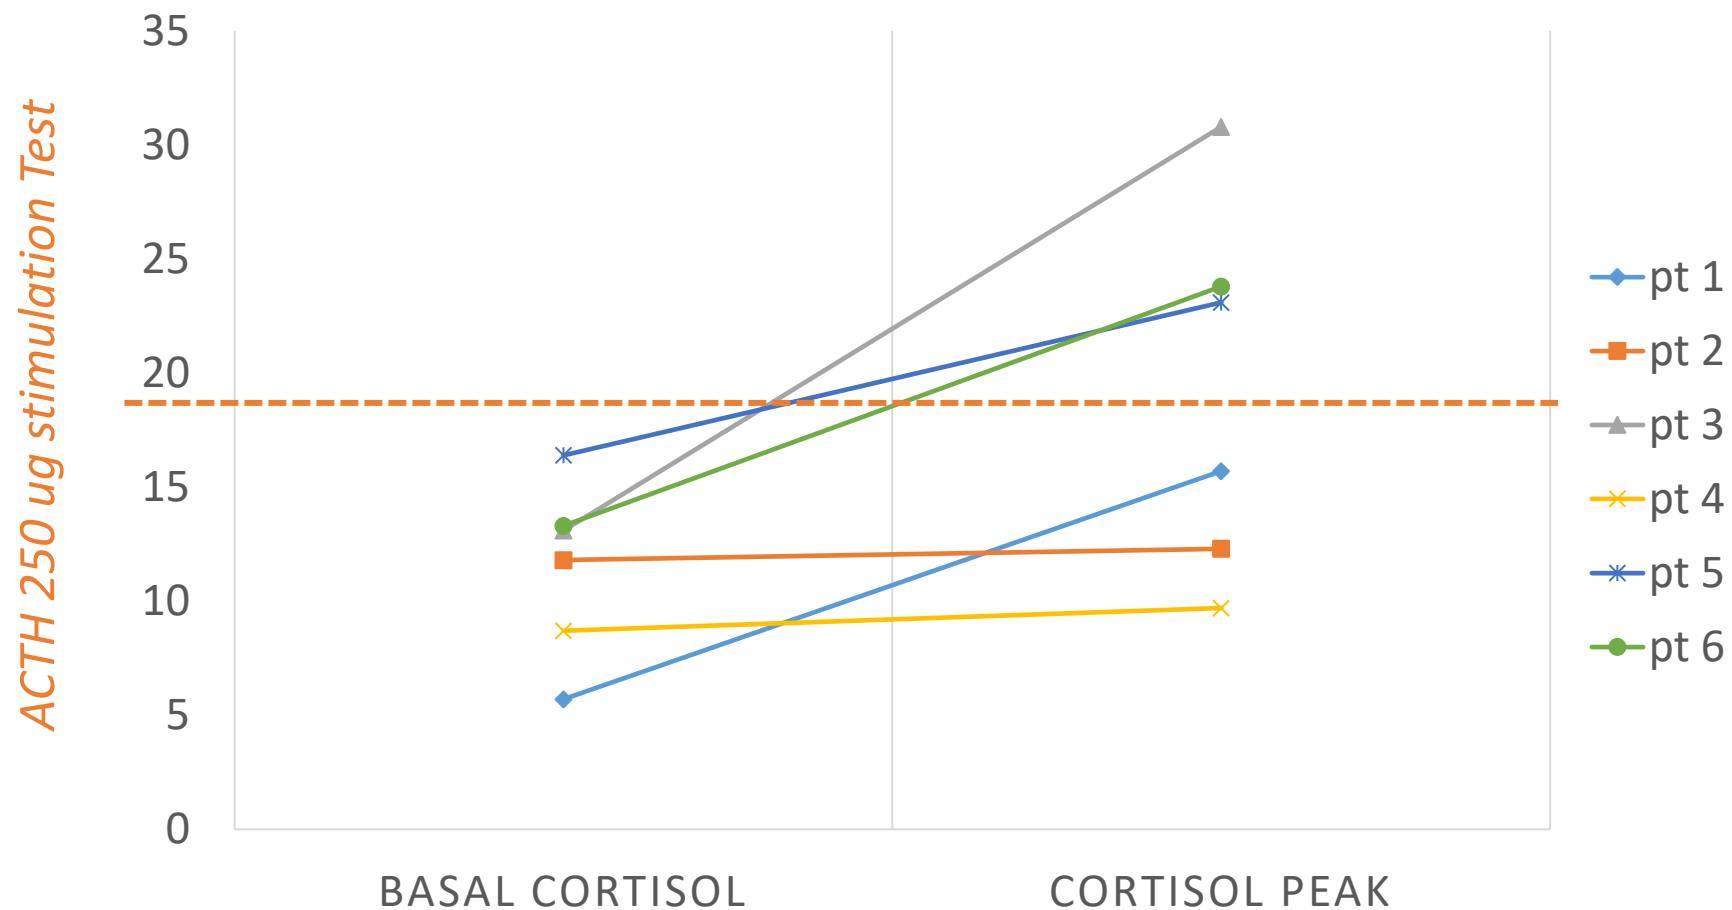

Fatigue

ADRENAL
INSUFFICIENCY
